

The effects of climate changes locally- GIURGIU,ROMANIA

Giurgiu is situated in the south part of Romania, near the Danube river, at 65 km away from the capital city Bucharest, at the border with Ruse, Bulgaria.

Climate changes effects locally

Giurgiu is facing hotter air, forest fires and drought.

Climate changes will occur so fast that the life of some plant species and animals are now in danger. This climate changes have a bad effect on the people's health. In addition, diseases transmitted through water and food could be affected by the climate change. These effects can be amplified by other stressors (exposure to ozone and fine particles caused by heat waves). Long-term exposure to fine particles in ambient air aggravates a number of conditions, such as chronic obstructive pulmonary disease.
